

Convolution Examples

$$\int_{-\infty}^{\infty} f(\tau)h(t - \tau)d\tau \quad (1)$$

1 $\text{rect} * \text{rect}$

$$\text{rect}(t/a) * \text{rect}(t/b) \quad (2)$$

where $a < b$.

Define $t_{\max} = (a + b)/2$ and $t_{\min} = (b - a)/2$.

Region 1 extends from $t = -t_{\max}$ to $t = -t_{\min}$ (partial overlap).

$$g(x) = \int_{-a/2}^{t+b/2} d\tau = t + b/2 + a/2 = t + t_{\max}. \quad (3)$$

Region 2 extends from $t \geq -t_{\min}$ to $t \leq t_{\min}$ (full overlap)

$$g(x) = a \quad (4)$$

Region 3 extends from $t = t_{\min}$ to $t = t_{\max}$ (partial overlap).

$$g(x) = \int_{t-b/2}^{a/2} d\tau = a/2 - (t - b/2) = t_{\max} - t \quad (5)$$

2 $e^{-at}u(t) * u(t)$

$$\int_0^t e^{-a\tau} d\tau = \frac{1 - e^{-at}}{a} \quad (6)$$

3 $e^{-at}u(t) * e^{-bt}u(t)$

$$\int_0^t e^{-a\tau} e^{b\tau - bt} d\tau = e^{-bt} \int_0^t e^{-(a-b)\tau} d\tau = \frac{e^{-bt} - e^{-at}}{a - b} \quad (7)$$

If $a = b$, we can simplify the result to te^{-at} (let $a = b$ inside the second integral).

If $b = 0$, the results simplify to the previous section.
